Electrochromic element contains an electrochromic layer of a film of polyphenylene polymer with 3000 or more wt. average molecular wt. contg. the repeating unit of formula (I): (R1 = H, or 1-30C alkyl; R2 = 3-30C alkyl)
USE/ADVANTAGE - Electrochromic elements for display, or optical shield glass.

In an example Fluorene (10g) was dissolved in ether with addn. of n-butyl lithium (30 ml) soln. and stirred with drops of n-bromohexane (11g) for 4 hrs. to obtain 9-mono hexylfluorene (11 g). Repetition of the reaction gave 9,9-dihexylfluorene (13 g). 9,9-dihexylfluorene was dissolved in chloroform and formed into a film (4 micron) on ITO electrode. An electrolyte soln. (LiBF4/acetonitrile) was added between the ITO electrode and pair electrode (ITO glass) with package of epoxy resin to form EC element.
